

METHOD AND APPARATUS USING ENHANCED ATTACHMENT  
FOR IMPROVED CONNECTIVITY IN TELECOMMUNICATIONS

ABSTRACT OF DISCLOSURE

Voice services provided over a packet switched facility  
such as a Frame Relay network are enhanced with routing  
capability by providing for attachment devices which, on  
initialization with the network, attempt to discover other  
similar attachment devices on the network. Thereafter the  
attachment devices exchange information on terminal  
accessibility to improve connectivity over the network.
